Labculture®

Class II, Type A2 Biological Safety Cabinets
The Safety Solution for Life Science Laboratories

NEW!

Class II, Type A2 Biological Safety Cabinets
The Safety Solution for Life Science Laboratories
Esco Labculture has passed more performance tests in more languages, for more certifications throughout more countries than any other biological safety cabinet in the world.
Containment and Protection
The airflow ratio of 63% recirculation to 37% exhaust increases operator protection beyond the 70%/30% ratio of conventional biological safety cabinets.

- The inflow and downflow balance is precisely established by an external exhaust damper and is adjustable without decontaminating the cabinet.
- Inflow of room air enters the front air grille to establish operator protection; room air does not enter the work zone, preventing product contamination.
- The front grille has proportionally larger perforations on the extreme left and right side. Combined with the side air gap between the work tray and the side wall, the stronger side capture zones increase protection in this critical area where contaminants tend to bleed out in conventional cabinets.
- The convex inflow grille maintains operator protection by discouraging users from placing objects on it.
- Auto-purge holes located at the front side walls eliminate eddy currents and dead air pockets in the critical area behind the sash window. Per NSF/ANSI 49 requirement, these side perforations do not extend completely to the work surface to prevent accidental liquid spills in the work zone from entering the side air column.

Integrated Filtration System
A combination of a supply ULPA filter and an exhaust ULPA filter give the Labculture cabinet a fully integrated performance envelope for product, operator and environmental protection.

- ULPA filters (per IEST-RP-CC001.3), are tested to a typical efficiency of >99.999% for 0.1 to 0.3 micron particles; these provide better filtration capability than conventional HEPA filters that have a typical efficiency of >99.99% for 0.3 micron particles.

Front Sash Assembly
- Integrated sash proximity contacts sense proper sash position, serve as an interlock for the UV lamp, and activate an alarm if the sash is improperly positioned.
- The magnetic switch eliminates the chance of wear and tear typical of a mechanical switch.
- The back of the sash can be easily cleaned by removing the sash track cover and swinging up the sash glass.
- The sash is counterbalanced for smooth, lightweight operation.
Cabinet Filtration System

**Dynamic air barrier, inflow and forward-directed downflow air converge**

- Ambient air is pulled through the perforations located towards the work zone front to prevent contamination of the work surface and product. The inflow does not mix with the clean air within the cabinet work zone. Inflow air travels through a return path toward the common air plenum (blower plenum) at the top of the cabinet.

- Approximately 37% of the air in the common plenum is exhausted through the ULPA filter to the room. The remaining 63% of the air is passed through the downflow ULPA filter and into the work area as a vertical laminar flow air stream bathing the work surface in clean air.

- The uniform, non-turbulent air stream protects against cross contamination within and throughout the work area.

- The counterbalance locking mechanism is inherently safe; it locks the counterbalance in place if either of the 2 cables is detached. The sash cable and cable clip have rated strength of more than 6 times the weight of the sash window of the largest Labculture Class II cabinet (1.8 meter / 6 ft. model).

**Blower Efficiency**

The Labculture blower system is designed for high performance operation, maximum energy efficiency and minimal maintenance.

- The external rotor motor design allows for optimum cooling of the motor during extended operations and extends the motor bearing life.

- The blower/motor can maintain airflow for a 150% increase in pressure loss over clean filters without manual speed control adjustment, or 210% increase in pressure drop across the filter due to fan suction.

**Sentinel™ Gold Microprocessor Control, Alarm, Monitoring System**

The Esco Sentinel™ Gold microprocessor-based control system supervises operation of all cabinet functions.

- The control panel is located on the center of the cabinet, and angled down for easy access by the operator.

- Continuous monitoring of cabinet airflow is displayed on a bright, easy-to-read LCD panel.

- An integrated, temperature-compensated, true airflow velocity sensor provides an accurate airflow reading despite room temperature fluctuation.

- All electronic parts are contained inside a plug-and-play module that permits easy exchange if required.

- Microprocessor software updates are available from Esco for download via the Internet. Sentinel functions are factory set to default to ON or OFF, depending on worldwide destination and local preferences. Default settings can be user activated through the touchpad data entry access.

- Automatic start-up sequence will prepare the cabinet for normal operation and advise when safe conditions are established.

- Selectable Quickstart mode, to automatically turn on/off the cabinet blower and lights by simply moving the sash window to the correct position.

- An administrator controlled PIN (Personal Identification Number) can be set to restrict access to main menu.

- The airflow alarm can be activated or deactivated depending on user preference and nature of the work.

---

**Esco Centrifugal Fan with External Rotor Motor (left) vs. Conventional Fan with Standard Motor (right)**

- Esco cabinets use German made **ebm-papst®** permanently lubricated, centrifugal motor/blower with external rotor designs.

- Integrated blades narrow the profile and eliminate need for a motor shaft.

- Motors are selected for energy efficiency, compact design, and flat profile. The completely integrated assembly optimizes motor cooling.

- All rotating parts are unitized and balanced for smooth, quiet, vibration-free operation.
Sentinel™ Gold Microprocessor Control System, Programmable

- When programmed ON: the start-up sequence confirms status with Air Safe and local time display.
- the Personal Identification Number (PIN) access restricts unauthorized adjustments.
- an airflow alarm warns of deviations from normal velocities.

Service fixtures are offset for easier reach. Standard cabinets include two fixture provisions on each sidewall (one provision on each sidewall for 0.9 meter/3 ft. cabinet). Electrical outlets are mounted below service fixtures to minimize obstructions.

Consult your Esco Operating Manual or contact your Sales Representative for information on user-preference programming capabilities built into the Sentinel microprocessor platform.

- The field calibration mode makes it easier for certifiers to calibrate the airflow display.
- RS 232 data output port enables remote monitoring of cabinet operating parameters.
- Optional TCP/IP converter to connect RS 232 to network for remote monitoring.

Cabinet Construction

Robust construction and enhanced safety features qualify the cabinet for the most demanding laboratory applications. The cabinet is fully assembled and ready to install and operate when shipped.

- The interior work area is formed from a single piece of stainless-steel with large radius corners to simplify cleaning.
- The cabinet work zone has no welded joints to collect contaminants or rust.
- All stainless steel work surfaces are accessible for cleaning.
- Tray components lift and remove to provide easy access and encourage surface decontamination.
- A recessed central area and stainless steel drain pan channels spills and prevent liquids from entering the lower filtration and blower systems.

- The drain pan is flush with the side walls to eliminate concealed or hard-to-clean spaces.
- There are no screws in on the front or sides to trap contaminants or complicate cleaning.
- Optional service fittings are offset for easier access.
- External plumbing is concealed behind trim panels to maintain aesthetics.
- External surfaces are coated with Esco Isocide™ antimicrobial coating to protect against surface contamination and inhibit bacterial growth. Isocide eliminates 99.9% of surface bacteria within 24 hours of exposure.

Color coded indicator lamps display green for primary function (fan operation); blue for secondary function (fluorescent lights and electrical outlet); and orange for caution (UV lamp ON).

diagram

Programmable automatic UV light timer simplifies operation, enhances contamination control, extends UV lamp life and saves energy.

**Comfortable Ergonomic Design**

The LA2 cabinet is engineered for comfort, utility value, and safety.

- The 10° angled viewing window and narrow profile front grille improves reach into the work area.
- The instant-start 5000k fluorescent lamp operates on an electronic ballast to reduce heat, improve comfort and conserve energy.
- The lamp delivers uniform lighting to the work surface for greater comfort, reduced glare and improved productivity; see Technical Specifications.

**Negative pressure**

The Esco triple-wall design creates a Dynamic Chamber™ plenum which surrounds contaminated areas with negative pressure, preventing the possibility of contamination from leaks in filter seal, gasket or cabinet structure. The third wall conceals utilities.

**Electrical Safety and Certification**

All components meet or exceed applicable safety requirements.

- Each cabinet is individually tested for electrical safety at factory.
- Documentation specific to each cabinet serial number is maintained on file.
- UL Listed for USA and Canada.
- Certified to all major world standards for biological safety cabinets, including the NSF / ANSI 49 and EN 12469 (refer to Standards Compliance table on this page for the full list).
- Contact Esco or your Sales Representative for site preparation information; see Electrical Specifications.

**Warranty**

The Labculture cabinet is warranted for 3 years excluding consumable parts and accessories.

- Each cabinet is shipped with a comprehensive user’s manual complete with a report documenting all test procedures.
- Additional IQ/OQ documentation is available upon request.
- Contact your local Sales Representative for specific warranty details or documentation requests.

**Accessories and Options**

Esco offers a variety of options and accessories to meet local applications. Contact Esco or your local Sales Representative for ordering information.

**Support Stands**

- Fixed height, available 711 mm (28") or 864 mm (34") ±38.1 mm (1.5")
  - With leveling feet
  - With casters
- Adjustable height, hydraulic range 711 mm to 864 mm (28" to 34")
  - With leveling feet
  - With casters
- Telescoping height stand for leveling feet, nominal range 660 mm or 960 mm (26" or 37.8")
  - Adjustable in 25.4 mm (1") increments

**Dynamic Chamber™ Plenum Design**

- The front armrest is raised above the workzone to improve comfort and to ensure that the operator’s arms do not block the forward airflow perforations.
- The optional adjustable support stand provides work surface height control.
- The frameless sash eliminates operator’s line of sight blockage
- A generous sash opening allows for easier access into the work zone, provides ample room for transferring of small equipment.
- The sliding window can be fully opened to insert and remove larger instrumentation and equipment.

---

**Accessories and Options**
- **Cradle stand**, electrically hydraulic, infinitely adjustable, with casters
  - Elevates to seating or standing work surface height.
  - When lowered permits movement through standard doorway.
  - Note: Increases exterior dimensions.

**Electrical Outlets and Utility Fixtures**
- **Electrical outlet**, ground fault, North America
- **Electrical outlet**, Europe / Worldwide
- **Petcock** (air, gas, vacuum)
  - North America (American) style
  - Europe / Worldwide style DIN 12898, DIN 12919, DIN 3537

**Cabinet Accessories**
- **Germicidal UV lamp**
  - Controlled by automatic UV lamp timer through Sentinel microprocessor control panel.
  - Emission of 253.7 nanometers for most efficient decontamination.
  - Lamp is positioned away from operator line-of-sight for safety and proper exposure to interior surfaces.
  - Note: UV lamp intensity reduces over time and its effectiveness is subject to factors such as relative humidity in the cabinet, ambient air temperature and microbial species in the work zone.
- **PVC armrest**
  - Chemically treated, improves operator comfort, easy-to-clean. 712 mm (28") standard size.
- **Ergonomic lab chair**
  - Laboratory grade construction, meets Class 100 cleanliness; alcohol resistant PVC materials
  - Adjustable 395-490 mm (15.6"-19.3")
- **Ergonomic foot rest**
  - Angled, helps maintain proper posture.
  - Adjustable height
  - Anti-skid coating, chemical resistant finish.
- **IV bar, with hooks**
  - Stainless steel construction
  - Available for all standard Esco cabinets.
- **Microscope viewing device**
  - Mounting and viewing pouch integrated into sash. Factory installed; specify when ordering.

**Comprehensive Performance Testing At Esco**

- Every Labculture LA2 model manufactured by Esco is individually tested, documented by serial number and validated with the following test methods.
  - Inflow / downflow velocity
  - PAO aerosol challenge for filter integrity
  - Light, noise and vibration
  - Airflow pattern visualization
  - Electrical safety to IEC61010-1
  - Additional KI-Discus containment and microbiological testing is performed on statistical sampling basis.
Microbiological Testing
Esco performs testing in accordance with more than 10 of the world’s most recognized standards for local, regional and international criteria. Testing in our microbiology laboratory is conducted according to NSF / ANSI 49, EN 12469, and JIS K3800. An NSF-accredited biohazard cabinet field certifier is available in-house full-time to supervise all testing work.

Harmless Bacillus Subtilis bacteria is used to challenge the cabinet, then incubated for 48 hours and the Colony Forming Units (CFU) are counted to determine the testing results. Increased microbiological challenge tests with objects inside the cabinet work zone, Bunsen burner, external airflow disturbance, and Human-As-Mannequin test adapted from Fume Hood development were performed to simulate real-world conditions.

Personnel Protection Test
The test objective is to evaluate the safety of the cabinet for the personnel operating on potentially hazardous samples in the cabinet workzone.

- A nebulizer containing 55 mL of 5 to 8 x 10^8 spores/mL B.Subtilis is placed inside the workzone, 10 cm (4 inches) behind the front opening sash.
- Target slit air samplers and impingers are placed outside the workzone to capture possibly escaping B.Subtilis spores, then the sample is incubated.
- Acceptance: The number of Bacillus Subtilis CFU recovered from the agar plates shall not exceed 2 CFU per test.

Product Protection Test
The test objective is to determine cabinet protection to the products/samples inside the cabinet workzone from environmental contaminants.

- A nebulizer containing 55 mL of 5 to 8 x 10^8 spores/mL B.Subtilis is placed at 10 cm (4 inches) in front of sash window.
- Target agar plates are placed throughout the entire work surface.
- Acceptance: The number of Bacillus Subtilis CFU recovered from the agar plates shall not exceed 5 CFU per test.

Cross Contamination Test
The test objective is to evaluate cabinet protection from cross contamination of samples placed simultaneously inside the workzone.

- A nebulizer containing 55 mL of spores (5 to 8 x 10^8/mL) is placed against one of the workzone sidewalls.
- Target agar plates are placed 36 cm (14”) away from the same side wall.
- Acceptance: The number of Bacillus Subtilis CFU recovered on agar plates shall not exceed 2 CFU per test.

HPV Test Compliant:
Safer Hydrogen Peroxide Decontamination Compatibility
Esco biological safety cabinets are Hydrogen Peroxide Vapor (HPV) compliant and decontaminatable cabinets tested with both BIOQUELL and STERIS patented processes. HPV (H2O2) is a safer and more efficient alternative to conventional decontamination using formaldehyde (CH2O):  
- HPV is non-carcinogenic and odorless, whereas formaldehyde is carcinogenic, toxic and has pungent smell.
- If there is a gap on the cabinet sealing, escaping HPV to the lab will decompose to become oxygen and water. Escaping formaldehyde, however, is harmful to people in the lab. Therefore HPV decontamination can be performed while people still working inside the lab, while formaldehyde decontamination must be performed with no one present in the lab. The HPV method improves safety, productivity, and reduces the time to seal the cabinet.
- HPV biological efficacy is independent of environmental variables, whereas formaldehyde efficacy is dependent on such variables.
- HPV has a better penetration capacity, resulting in a full decontamination of the cabinet. The formaldehyde method is known to result in incomplete decontamination.
- HPV is more effective and rapid against biological organisms compared to formaldehyde.
- HPV requires approximately 4-7 hours for set-up, decontamination, and tear-down, compared to a total of 12-15 hours needed to complete a formaldehyde decontamination process.
- HPV decontamination effectiveness is independent of temperature and humidity. Formaldehyde requires temperature above 20°C and relative humidity above 65%.
- For information on the BIOQUELL and STERIS HPV methodologies, contact Esco or your Esco Sales Representative and ask for our HPV Decontamination Whitepapers.

The Performance Envelope Concept
Esco cabinets are designed to operate within a performance envelope to maintain protection for personnel, product and the environment.

The graph illustrates the boundaries of the performance envelope (based on a 1.2 meter / 4 ft. cabinet), as well as the nominal performance point at which tests are conducted. The range between high and low Inflow, and high and low Downflow, together with the fluid dynamics achieved through sophisticated cabinet design, proportionally size capture slots, and uniform laminar airflow, combine to deliver a complete containment and safety solution expected of a professional biological safety cabinet. For details on the Esco performance envelope contact Esco or your Esco Sales Representative.

KI Discus Containment Test According to EN 12469 (Potassium Iodide)
Esco is currently one of the few companies in the world equipped to perform the KI Discus test for our customers. The KI Discus test is defined in the European Standard for microbiological safety cabinets, EN 12469, as a test method for validating the operator/ personnel protection capabilities of the cabinet.

- The KI Discus test shows excellent correlation with the microbiological
test method for operator protection, and is useful for validating the actual containment performance of the cabinet on-site.

- The KI-Discus takes only 45 minutes as opposed to 2 days for microbiological testing.
- Thus, Esco Labculture LA2 models are factory tested on sampling basis using the KI Discus method for operator safety.

Purchase Specifications
LA2 Series Class II, Type A2 Biological Safety Cabinet

General Performance and Certifications
1. The biological safety cabinet shall comply with one or more of the following international standards, and the manufacturer shall provide a certified copy of containment and performance tests equivalent to or greater than specified in the following independent international standards for biological safety, electrical and other functional characteristics: Class II, Type A2 per NSF / ANSI 49 (USA); Class II per EN 12469, J5 K3800, SFDA YY-0569, SANS12469.
2. The cabinet shall protect (a) the operator and laboratory environment from particulates generated within the work zone; (b) the product and process within the work zone from airborne contamination from ambient air; (c) and the product and process within the work zone from cross contamination.
3. The cabinet shall be tested by KI-Discus test (European Standard EN12469:2000) on statistical sampling basis to validate operator/personnel protection. The retention efficiency for the front aperture shall be not less than 99.999%. Microbiological testing for cabinet performance shall also be performed on a statistical sampling basis.
4. Each cabinet shall be listed by Underwriters’ Laboratories (UL, CUL) or CE for electrical safety.
5. Original documentation specific to each cabinet serial number shall be provided with the cabinet and maintained in the manufacturers’ records. Test data verifying all performance criteria shall be available upon request to include: (a) inflow velocity through direct inflow measurement method; (b) downflow velocity and uniformity; (c) filter leak scan with aerosol challenge for both filters; (d) light, noise, vibration; (e) and electrical safety.

Filtration System
6. The cabinet shall have one supply downflow filter and one exhaust filter. Both filters shall be ULPA-type per IEST-RP-CC001.3 and meet EN1822 (H14) requirements.
7. The filters shall be within an aluminum frame with mini-pleat design without aluminum separators; no wood or fiberboard shall be used in the filter assembly.
8. Typical filter efficiency shall be >99.999% at MPPS and between 0.1 to 0.3 microns.
9. An integral filter guard shall be affixed to prevent damage to the filter media. The exhaust filter shall further be protected by angled staggered exhaust damper.
10. The filters shall be (a) individually scan tested by the manufacturer, (b) individually scan tested after assembly, and (b) easily accessible for scan testing in situ by means of a dedicated upstream sampling port accessible from within the cabinet.
11. The supply filter shall be angled and oriented to the 10° cabinet front angle to maximize downflow uniformity over the work surface.
12. A removable, perforated metal diffuser shall be installed below the supply filter to optimize airflow uniformity and to protect from damage.

Blower System
13. The cabinet shall have a direct drive, permanently lubricated centrifugal blower/motor dynamically balanced in two planes compliant to ISO22710 for low noise, low vibration and long filter life.
14. The blower/motor shall have an external rotor design and include an automatic thermal cut-out to disable the motor in case of overheating.
15. The blower/motor shall have an automatic speed control to compensate for filter loading.
16. The blower/motor system shall be enclosed within a dynamic chamber shaped steel plenum and integrated with the removable supply filter assembly to simplify filter changing.
17. The integral damper shall be externally adjustable.

Cabinet Design, Construction, Cleaning
18. The cabinet shall be of triple wall design whereby all positive pressure plenums capable of handling contaminated air shall be surrounded by negative pressure. No positive pressure areas shall be accessible external to the cabinet. The third wall shall conceal utilities.
19. The cabinet shall maintain containment performance even when removable work area components are removed for cleaning.
20. The work tray shall be one-piece, removable, stainless steel with radius corners without crevices or joints.
21. The cabinet shall have a stainless steel, one-piece fabricated drain trough with open angles to channel spills to a common drain.
22. The closed sidewall shall be sealed without perforations, return air slots or concealed areas which can contain contaminants.
23. The cabinet shall be free of sharp edges, non-functional protrusions, bolts, screws or hardware, and all metal edges shall be deburred.
24. The cabinet exterior top shall be slanted to discourage placement of foreign objects and to maintain proper exhaust airflow.

Ergonomics and Convenience
25. The front sash shall be frameless to maximize visibility, and accessible for cleaning front and back. Sash glass shall be safety glass.
26. The sash counterbalance shall be suspended on two high-strength cables, and the sash shall lock into position in the event one cable becomes detached.
27. Magnetic, not mechanical, proximity sensors shall work in conjunction with the control system to indicate proper sash position for containment.
28. Fluorescent lamps shall be mounted behind the control panel module out of the work zone. Electronic ballasts shall be used to eliminate flicker, extend lamp life and reduce heat output.
29. The UV lamp shall operate via an automatic timer with automatic shut-off managed by the microprocessor controller and shall be interlocked with the blower/motor and fluorescent lights for safety.
30. The cabinet shall be designed with a 10° angled front to optimize user comfort, reduce glare and maximize reaching into the work area.
31. The front grille shall be raised to prevent airflow blockage and improve comfort.
32. Penetrations for petcocks and service fittings shall be provided; penetrations shall be offset to improve user access.
33. The cabinet shall accommodate an optional mounting stand for fixed-height or adjustable-height configurations.
34. The sash window shall be able to be lowered further down by removing the arm rest, to easily clean the upper back side of the glass.

Control and Alarm System
35. All cabinet functions shall be managed by a programmable microprocessor control system capable of software updates via Internet downloads.
36. The microprocessor controller shall be mounted on the main control panel facing down toward the user.
37. The controller shall include soft-touch keypad controls and backlit LCD displays to permit operation of the blower/motor, light, UV lamp, electrical outlet(s) and menu.
38. The LCD shall simultaneously display inflow, downflow, sash status, airflow status, and filter life.
39. The controller shall be user programmable in situ to enable or disable functions such as PIN (personal identification number) access restriction, cabinet start-up protocol, airflow alarm and other microprocessor controlled operations outlined in the user manual.
40. When programmed ON, the start-up protocol shall perform an automatic pre-purge and post-purge cycle to ensure proper cabinet operation.
41. The controller shall include a blower/motor hours meter to display aggregate motor running time to assist in predictive maintenance.
42. Audible and visual alarms shall be provided for unsafe conditions such as improper airflow or sash position.
43. Airflow shall be monitored by a temperature compensating, thermostat-based, true air velocity sensor mounted in the cabinet.
44. The airflow display and alarm system shall be individually calibrated before shipment.
45. The main control panel shall exhibit continuous display of air velocity and a 24-hour clock display.
46. Diagnostics button should be available on the control panel, to easily check the cabinet operating parameters and assist servicing.
47. The cabinet shall have field calibration mode that simplifies on-site calibration procedures.
48. A selectable Quickstart mode should be available to automatically turn the blower and lights on/off by moving the sash window to correct position.
49. The BSC shall have RS 232 data output port for remote monitoring of cabinet operating parameters.
50. TCP/IP converter shall be available as an option, to connect RS 232 to network for remote monitoring.

Certification, Service and Decontamination
51. The cabinet shall be approved for both hydrogen peroxide vapor (HPV) and formaldehyde decontamination protocol.
52. All panels leading to potentially contaminated and/or hazardous areas shall be color coded red.
53. All components with the exception of blower/motor and ULPA filters shall be located outside of contaminated air spaces to facilitate servicing without the need to decontaminate the cabinet.
54. All exterior surfaces shall be painted with a permanent antimicrobial inhibitor coating to minimize contamination.
Since 1978, Esco has emerged as a leader in the development of controlled environment, laboratory and cleanroom equipment solutions. Products sold in more than 100 countries include biological safety cabinets, cleanroom products, compounding pharmacy equipment, containment / pharma products, ductless fume hoods, in vitro fertilization workstations, lab animal research products, laboratory fume hoods, laboratory ovens and incubators, laminar flow clean benches and PCR products and instrumentation. With the most extensive product line in the industry, Esco has passed more tests, in more languages, for more certifications, throughout more countries than any biosafety cabinet manufacturer in the world. Esco remains dedicated to delivering innovative solutions for the clinical, life science, research and industrial laboratory community. www.escoglobal.com.
